Agentic Workflow Summary

Supported findings: No finding
Uncertain findings: None
Final report labels: No finding
Pattern buckets: No acute abnormality

Evidence and Report Summary

Findings

Both the Swin classifier and YOLO detector demonstrate strong agreement in identifying no acute abnormalities on this chest radiograph. The Swin classifier shows a very high probability (99.87%) for 'No finding' with all other pathological findings having very low probabilities (all <0.05%). No localizable abnormalities were detected by the YOLO detector. The lung fields appear clear with normal cardiomediastinal contours and no evidence of pleural abnormalities.

Impression

No acute cardiopulmonary abnormality identified on this chest radiograph. Both AI models demonstrate strong concordance in this assessment.

Top Swin Probabilities

- No finding: 0.999
- Nodule/Mass: 0.000
- Pulmonary fibrosis: 0.000
- Lung Opacity: 0.000
- Other lesion: 0.000
- Calcification: 0.000

- None

Presentation Takeaway

Swin correct labels: 1 / 1
YOLO correct labels: 1 / 1
Key miss for Swin: None
Key miss for YOLO: None

Thresholds Used

Swin positive label cutoff: 0.50
YOLO detection confidence cutoff: 0.25
Agentic AI confidence band is qualitative, not a fixed numeric threshold.

This is an AI-generated decision-support summary that requires human radiologist review and interpretation for clinical use. This analysis

Confidence Calculation

How this case's confidence was calculated

Per-finding band cutoffs: high ≥ 0.80 , moderate ≥ 0.50 , low < 0.50 .

Swin label threshold = 0.50. YOLO detection threshold = 0.25.

No finding: high from score = Swin(1.00)

Agentic AI report band reference: `high` occurred in 236 / 300 cases with exact-match accuracy 90.7%.

Interpretation note: the report-level agentic AI confidence band is constrained to high / moderate / low in the schema, but the model chooses that band. The per-finding confidence lines above are deterministic and computed from the Swin probability, YOLO support, and the label taxonomy.

This is an AI-generated decision-support summary that requires human radiologist review and interpretation for clinical use. This analysis
